1 Introduction

There's not much here yet ... but hopefully I will be adding to this in the future.

To do:

- use `predict`, `simulate` etc. to demonstrate different parametric bootstrap approaches to confidence and prediction intervals
 - use `predict` to get means and standard deviations, use delta method?
 - use `vcov`, assuming quadratic profiles, with `predict(..., newparams=...)`
 - prediction intervals assuming no parameter uncertainty with `simulate`
 - both together ...
